

ARCHITECTURE EVOLUTION

Software Architecture Evolution

One frequently accompanying property of evolution is an increasing brittleness of the system – that is, an increasing resistance to change, or at least to changing gracefully.

- Perry & Wolf, 92.

- Architectural Drift
- Architectural Erosion

Software systems must evolve or become obsolete

- Lehmann'80.

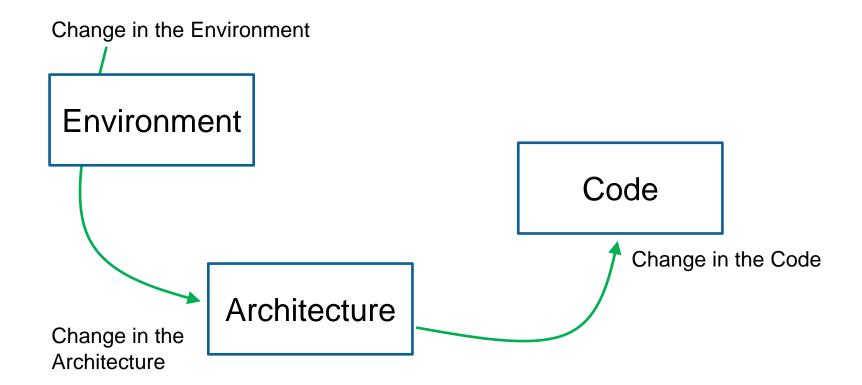

Software Architecture Erosion

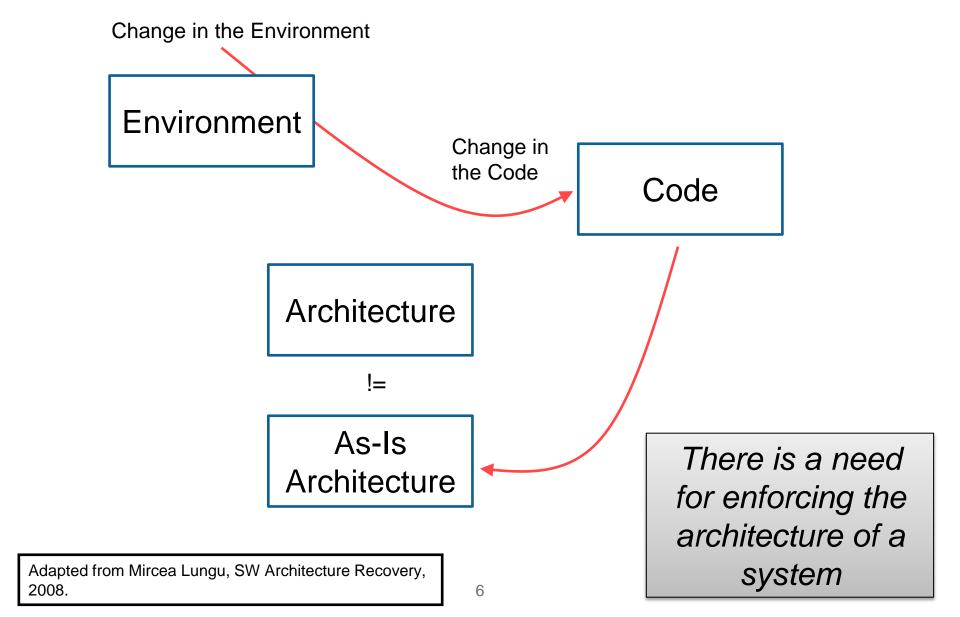

Refers to the gap observed between the planned and actual architecture of a software system as realized in its implementation

- Terra, Valente, Czarnecki, Bigonha, 2012

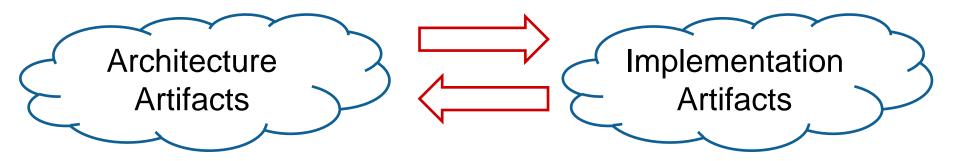

Two types of changes

Two types of changes

Keeping Architecture and Implementation in Sync

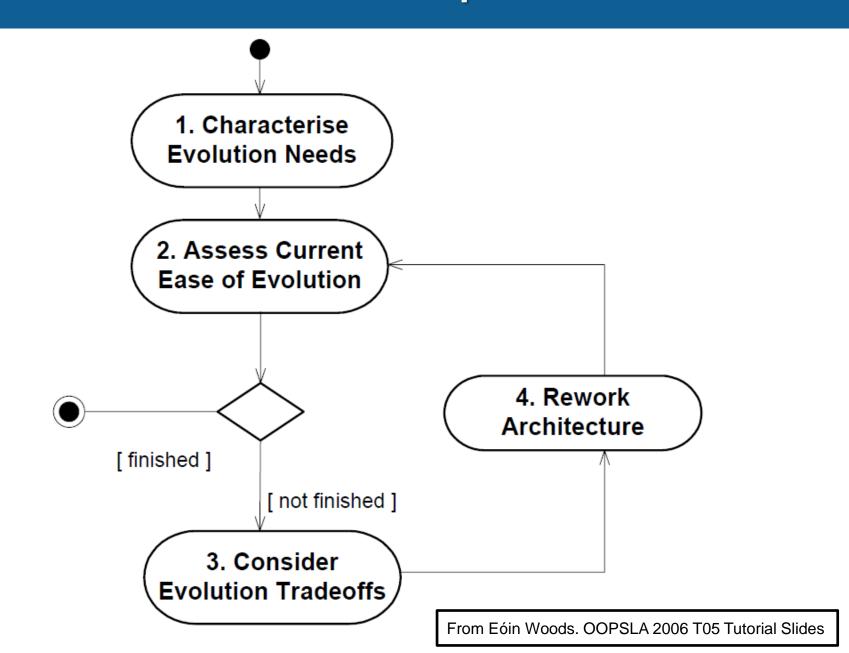

- Keeping architecture and implementation in sync is a difficult technical and organizational problem
- Possible approaches to keep them in sync:
 - Create and maintain traceability links between architecture and implementation artifacts
 - Make the architectural model part of the implementation
 - Generate some or all of the implementation from the architecture

SW Architecture Evolution Perspective by Rozanski and Woods: Quality, Applicability, and Concerns

Quality	The ability of the system to be flexible in the face of the inevitable change that all systems experience after deployment, balanced against the costs of providing such flexibility
Applicability	Important for all systems to some extent; more important for longer- lived and more widely used systems
Concerns	 product management magnitude of change dimensions of change likelihood of change timescale for change when to pay for change changes driven by external factors development complexity preservation of knowledge reliability of change

Actitives of the Evolution Perspective

SW Architecture Evolution Perspective by Rozanski and Woods: Tactics and Pitfalls

Tactics	 contain change create extensible interfaces apply design techniques that facilitate change apply metamodel-based architectural styles build variation points into the software use standard extension points achieve reliable change preserve development environments
Pitfalls	 prioritization of the wrong dimensions changes that never happen impacts of evolution on critical quality properties overreliance on specific hardware or software lost development environments ad hoc release management

SOFTWARE ARCHITECTURE RECONSTRUCTION

Missing Architectural Specifications

Frequently we are asked to analyze a system's software architecture and are given only its code and the (limited) time of a designer.

- Kazman et al. 1999

 For many systems the architecture is not documented or not sufficiently documented

Software Architecture Reconstruction (also Recovery)

Techniques and processes used to uncover a system's architecture from available information

- Jazayeri, Ran, van der Linde, 2000

Relation to Architecture Views

 Architecture recovery addresses the extraction of architectural views that represent the system

Architecture View: Work product expressing the architecture of a system from the perspective of specific system concerns.

Architecture Viewpoint: Work product establishing the conventions for the construction, interpretation and use of architecture views to frame specific system concerns.

- ISO/IEC/IEEE 42010:2011: Systems and software engineering — Architecture description

Example: 4+1 View Model and Related UML Diagrams

From: Applying 4+1 View Architecture with UML 2. http://www.sparxsystems.com.au/downloads/whitepaper s/FCGSS_US_WP_Applying_4+1_w_UML2.pdf

Architectural Components

A software component is an architectural entity that

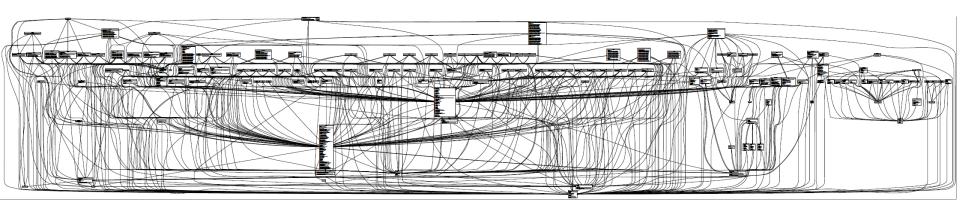

- encapsulates a subset of the system's functionality and/or data
- restricts access to that subset via an explicitly defined interface
- has explicitly defined dependencies on its required execution context.

Taylor, Medvidovic, Dashofy, Software Architecture: Foundations,
 Theory, and Practice

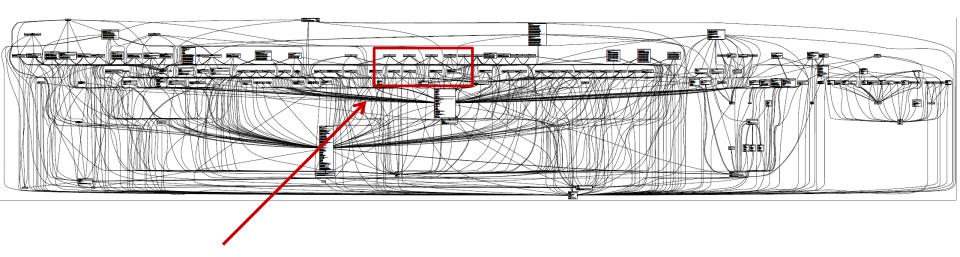

Components: Key System Concerns

- Components address different key system concerns:
 - Processing (aka functionality, behavior)
 - State (aka information, data)
 - Interaction (aka interconnection, communication, coordination, mediation)
- Interaction is typically handled by connectors

Example: Implementation-Level View of the Frag Scripting Language

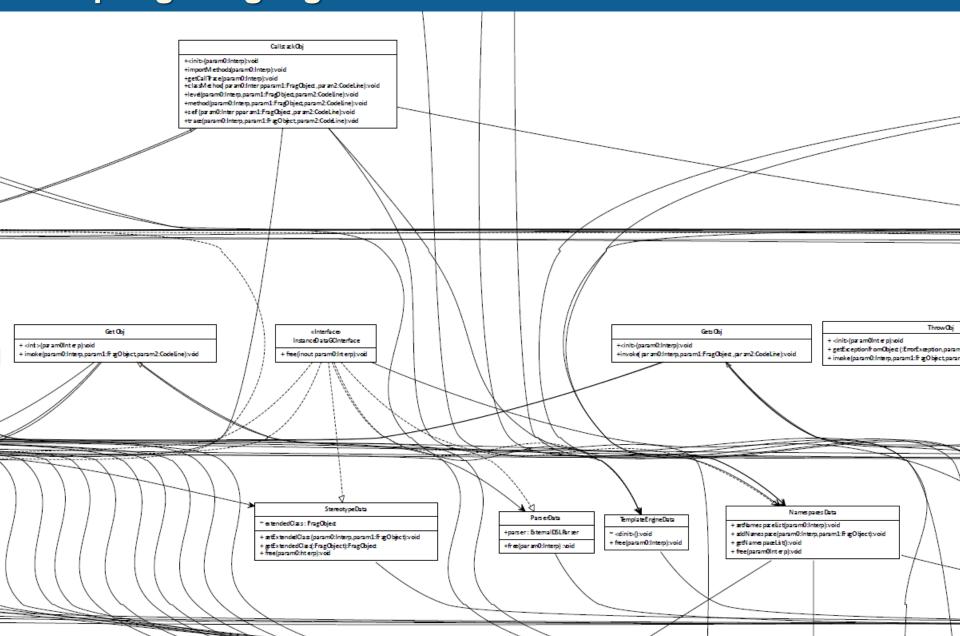

Example: Implementation-Level View of the Frag Scripting Language

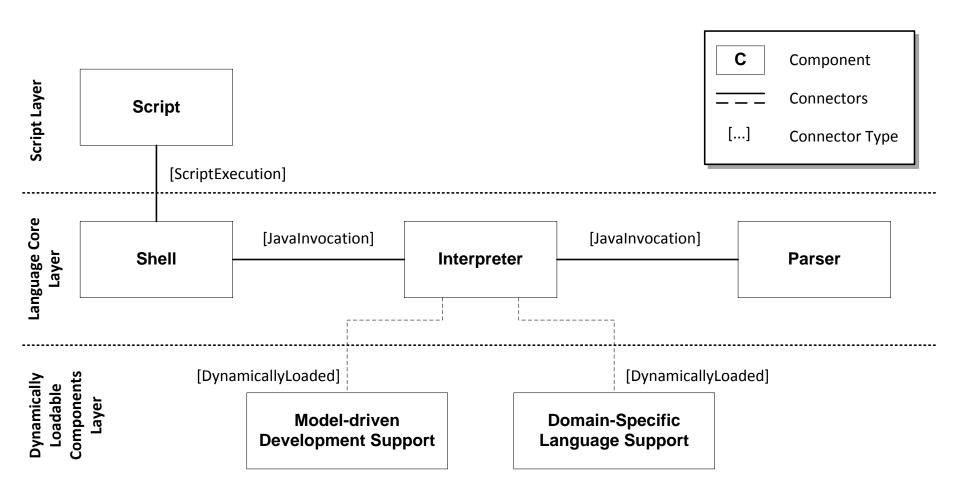

Lets zoom in here.

Example: Implementation-Level View of the Frag Scripting Language

Example: Architectural Component Model of the Frag Scripting Language

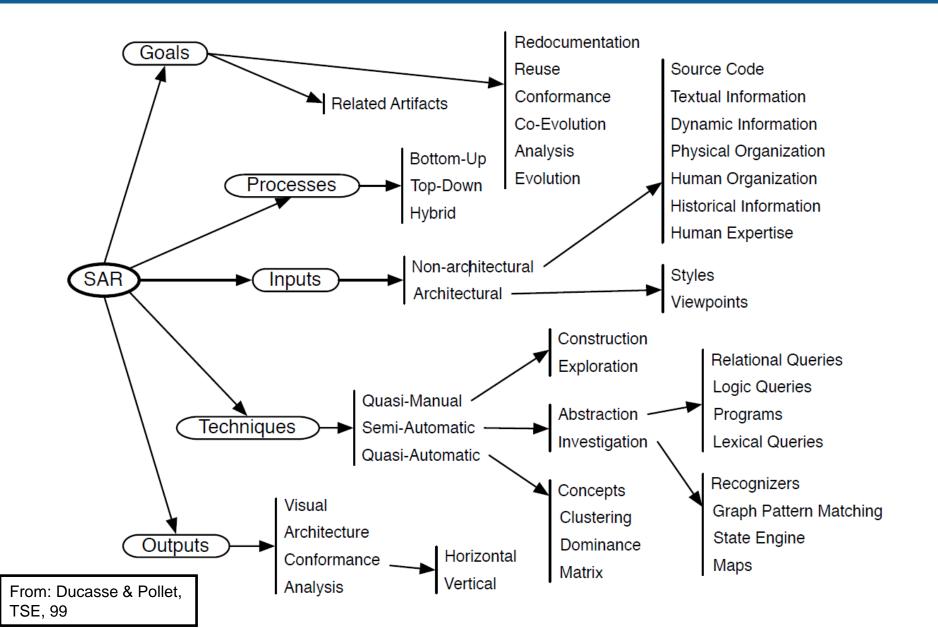

SOFTWARE ARCHITECTURE RECONSTRUCTION: MAJOR APPROACHES

Sources for Data Extraction

- Source code (static analyis)
- Historical information
- Human expertize
- Runtime behavior (dynamic analysis)
- Physical organization
- Social organization

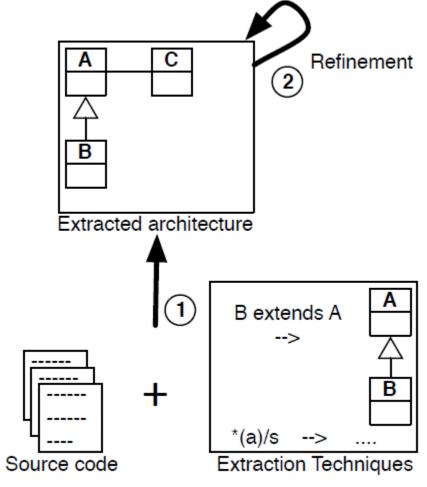

A process-oriented taxonomy for SAR

Bottom-up Processess

1. From the source code, views are extracted

2. The views are refined

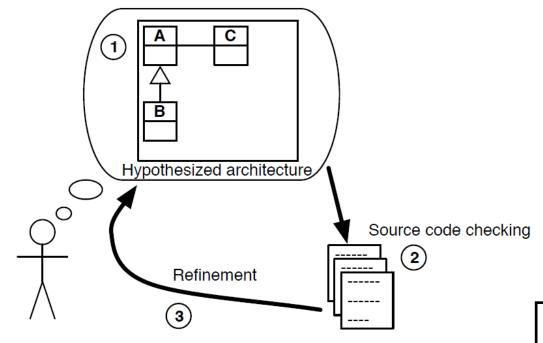

From: Ducasse & Pollet.

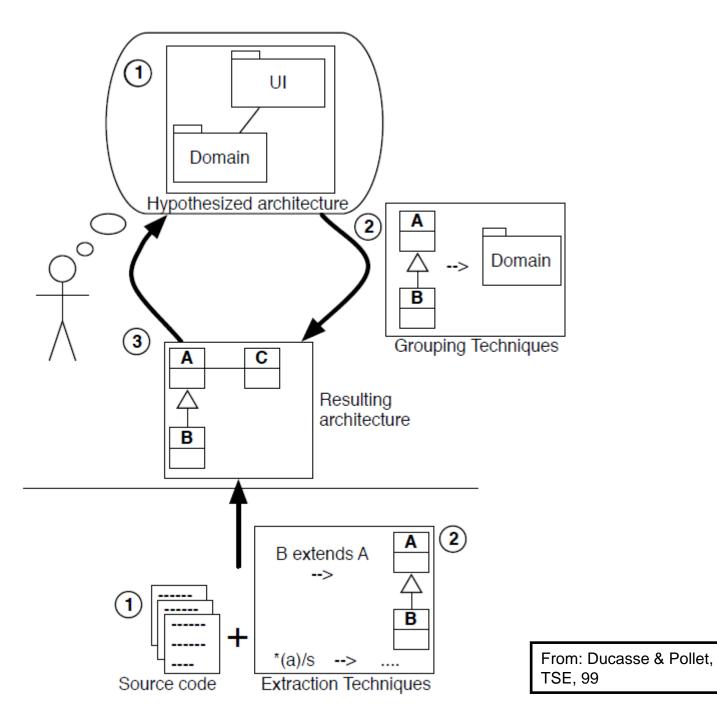

TSE, 99

Top-down Processess

- 1. An hypothesized architecture is defined
- 2. The architecture is checked against the source code
- 3. The architecture is refined

From: Ducasse & Pollet, TSE, 99

Existing Approaches and the Process They Use
